322 Compilers Assignment: spill
Register allocation: spilling
Due Monday April 11th, noon

Your job: Implement spilling. See the spill-test assignment for details on how the spilling script should behave.

Handin instructions: Your handin must run on the t-lab machines (under linux).
Hand in your assignment by sending email with the subject spill to robby@eecs.northwestern.edu. The email should include an attachment named name.spill.tar.gz. The name should be your last name in all lowercase letters unless you are pair programming, in which case it should be both last names in alphabetical order, separated by +. For example, if Robert Jordan and Brandon Sanderson were pair programming and handing in this assignment, they’d send in a tarfile named jordan+sanderson.spill.tar.gz.

The attachment must contain (at the top-level) the spill executable.

The top-level directory can also contain executables that correspond to earlier assignments; they will be re-run in the test fest for this week.
